                                                                                                                                                                                                                                                               The present sequence encodes human activation-induced cytidine deaminase
(AID) AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallargic,
antianaemic, antiasthmatic, ophthalmological, anti-HYV and
dermatological activities, and can be used in gene therapy. AID
collinucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoglobulin A (19A) deficiency
clisease, igh nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
disease, DiGeorge disease, ataxia telangiectasia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
ig disorder, and igg subclass selection disorder. The DNA sequences
encoding AID may be used for gene therapy and the antibodies to the AID
encoding AID may be used for gene therapy and the antibodies control

AAATAATATAAAAGTGATTTATATGAAGT 2760 AID; cytidine deaminase; gic disease; antiallergic; ggical; anti-HIV; dermatological; system disorder; food allergy; in A deficiency disease; asthma; ppic dermatitis; allergic colitis; disease; Diceorge disease; AIDS; immunodeficiency disorder; ichency disease; oclass selection disorder; ds. The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antiantamic, ophthalmological, antiallergic, antiathmatic, ophthalmological, anti-HIV and dermatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency disease and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences cytidine deaminase, useful as related diseases including se genomic DNA SEQ ID NO:10. ပ္ပ

The present invention describes an activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antialergic,
antiandemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
polynucleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoglobulin A (IgA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhintis, Rosen
disease, bideorge disease, ataxia telangiectessia, common variable
immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated
Ig disorder, and IgG subclass selection disorder. The DNA sequences

AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antialergic, antiasthmatic, ophthalmological, anti-HIV and dermatological activities, and can be used in gene therapy. All polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, altergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disorder, MHC (major histocompatalility class) class II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                         AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of heamatopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic-derived cells. AAK64703
sequences from the present invention. AAK54951 contigen genomic

polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinnemia, atopic dermatitis, allergic colitis, asthma, food allergy, drug allergy, allergic rhintis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disorder, MHC (major histocompatibility class) class II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IGE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders.
                                                                                                                                                                                                                                                                                                                                       GAAGCAGCCTTGCTTGAAGCAAGCTTCCTTTGGCCCTAAGACTTTGAGGAGTCAAGAAAG

AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antiantamentc, antiasthmatic, ophthalmological, anti-HIV and dermatological activities, and can be used in gene therapy. AID

proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to o prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cancers from the present invention. AAK6492 to AAK875950 and AAM82169 represent sequences from the present invention.

 and sequences given in AMM8170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting protein. (1) proteins and polynucleotides may be used to produce the secreted (1), by inserting protein. (1) proteins and polynucleotides may be used to produce the secreted (1), by inserting protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-derived cells. AAK64703 to AAK87644 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK5492 to AAK5450 and AAM82169 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CGAACCGTGGCACACGCTCATAGTTCTAGCTGCGTTGGGAGGTTGAGGAGGAGGATGGCT 1745

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The nucleic acids, proteins, antibodies and (antibodies are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital, (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel genes (ABA07454-ABA08224) and proteins (AABA0743-ABB10980) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated ovarian and/or breast cancer related nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders, particularly ovarian and/or breast cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.

                                                                                                                                                                                                                                                                                                                    pp
                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast on ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and enterprise and parastic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GTTGAGGAGGAGGATGCCTTGAACACAGGTGTTCAAGGCCAGCCTGGGCAACATAACAA 1785

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecule encoding a reproductive system antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is used in preventing, treating or ameliorating a medical condition

anthon acid sequences given in AAMB1921. (I) have cytostatic anthon acid sequences given in AAMB1921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) to proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally. (I) c supplement the patients own produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the proteins and polynucleotides may be used to prevent.

C protein. (I) proteins and polynucleotides may be used to prevent.

diagnose and treat immune/haematopoietic-related diseases, especially cancer metastases of haematopoietic-derived cells. AAK64703

to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK849421 to AAK84950 and AAM82169

represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; SEQ ID NO 22051; 3071pp + Sequence Listing; English.

(HUMA-) HUMAN GENOME SCI INC

SM Rosen CA, Barash SC,

WPI; 2001-541565/60.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system useful for preventing, cancers and metastases

Disclosure; SEQ ID NO 7762; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18011) useful for preventing, treating or ameliorating medical conditions e.g. by protein or the rapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone
